

March 2016

To those interested:

I decided to try the Promolux LED lights in my dental office. We were looking for a more balanced room lighting to improve our colour analysis and shade matching.

Initially I equipped one operatory with the new lighting to test it in comparison to my original lighting. We compared the lighting in the two operatories over a two-month period and during that time we discovered that our colour and shade matching improved, that we had better colour definition, less glare and less eye fatigue. For those reasons, I found myself gravitating towards the room with the LED lights whenever possible. Subsequently I have equipped the second operatory with the Promolux LED lights and also several other work areas.

In conclusion, I am very happy with the new Promolux LED lights in my office for all of the reasons stated above and I would be most unhappy to return to working with the original lighting.

Sincerely,

Ronald G Smith, B.Sc., DDS.
